Website review for 101evler

Emin Khanlarov · 9 November 2026

I used www.101evler.com the way an ordinary visitor would: on a computer, on a simulated slow mobile connection, and with the keyboard only. These are the points that would help your visitors most.

What is working well

- **The site is secure and its links are tidy.** Every visit is encrypted, and page addresses are short and readable, so they are safe and easy to share.
- **Dead ends are handled kindly.** When a page or listing no longer exists, visitors get a clear message and links to carry on, not a broken page.

The three things to fix first

1. Forms, links and buttons have no names

What visitors experience: The boxes in the "send a message" form show their hint text only until you start typing. Many photo links and icon buttons have no name at all, so people who use a screen reader (software that reads the page aloud) hear only "link" or "button".
Why it matters to you: The contact form is how buyers reach your agents. Blind and partially sighted visitors cannot use it on their own.
What to ask your web developer: "Please add a visible label to every form field, a short description to every photo and logo, and a spoken name to every icon button."

2. Visitors cannot zoom in on phones

What visitors experience: On some phones, pinching to enlarge small text such as prices does nothing.
Why it matters to you: Older visitors and people with weak eyesight may give up on a listing they cannot read.
What to ask your web developer: "Please remove `maximum-scale=1` from the viewport setting so that zooming works."

3. A blank screen on slow connections

What visitors experience: On a slow mobile connection, the page stays white for about two and a half seconds, and about a third of what it downloads is advertising and tracking code, not homes.
Why it matters to you: Some visitors leave before anything appears, and every visit uses more of their mobile data than needed.
What to ask your web developer: "Please load the advertising and statistics scripts after the listings appear, show something while the page loads, and let browsers keep photos for longer."

How to check it is fixed

1. In Google Chrome, run the free "Lighthouse" check on a listing page: the Accessibility score should rise from 53 to above 90, and clicking the word above a form field should put the cursor in that field.
2. Open a listing on your phone and pinch to zoom in on the price: the text should get bigger.
3. Open the home page on your phone using mobile data, not Wi-Fi: something useful should appear at once instead of a white screen.

Thank you for running a site that so many people rely on to find a home in North Cyprus; I hope these points are useful.
